Changing Precipitation Regimes and Terrestrial Ecosystems August 19, 2021 By the beginning of the twenty-first century, few people could deny the reality of global change, while most alarm has been over increasing temperatures, other changes are occurring in precipitation patterns. Variations that may be due in part to global warming factors such as changes in atmospheric circulation and land surfaces. This volume provides a central source of information about this newly emerging area of geology research. It presents ongoing investigations into the responses of plant communities and ecosystems to the experimental manipulation of precipitation in a variety of settings, particularly in the western and central United States, where precipitation is already scarce or variable. By exploring methods that can be used to predict ecosystem responses to changes in precipitation regimes, it demonstrates new approaches to global change research and highlights the importance of precipitation regimes in ecosystems. The contributors first document the importance of precipitation, soil characteristics, and soil moisture to plant life. They then focus on the roles of amount, seasonality, and frequency in shaping varied terrestrial ecosystems: desert, sagebrush steppe, oak savanna, tall- and mixed-grass prairie, and eastern deciduous forest. These case studies illustrate many complex, tightly woven, interactive relationships among precipitation, soils, and plants—relationships that will dictate the response of ecosystems to changes in precipitation regimes. The approaches utilized in these chapters include spatial comparisons of vegetation structure and function across ecosystems; analyses of changes in plant architecture and physiology in response to temporal variation in precipitation; experiments to manipulate water availability; and modeling approaches that characterize the relationships between climate variables and vegetation types. All seek to assess vegetation responses to major shifts that appear to be occurring at present and may become the norm in the future. As the first volume to discuss and document current and cutting-edge concepts and research into changing precipitation regimes and terrestrial ecosystems, this book shows the importance of developing reliable predictions of the precipitation changes that will occur with global warming. These studies clearly demonstrate that patterns of environmental variation and the nature of vegetation responses are complex phenomena only beginning to be understood, and that these experimental approaches are critical for our understanding of future change.

God's Equation August 02, 2022 God's Equation presents the latest developments in cosmology, the study of the nature of the universe. Internationally renowned mathematician Michael Aczel reveals that Einstein's initial theory about the stars and galaxies, for many years dismissed as a 'blunder', appears to have been proved correct by astronomical observations. Convincing evidence that Einstein was close to understanding God's equation for the nature of the universe.

Flash Fiction October 31, 2019 Definitions of flash fiction vary, but they are usually short stories ranging from a few words to a few hundred words. Our template encourages you to start with basic character ideas and themes and then to start writing. You can customize this template to create other starting points, like keywords, writing prompts, and particular scenarios. There are many ways to publish it for different niches including fanfiction, erotica, horror or historical fiction, and you could even rework it to help you learn to write true life stories. Flash fiction is popular online. Twitter for example has a character limit of 280, so may be a popular venue for very short flash fiction. You can also publish flash fiction and there are even designated spaces on sites like Wattpad. There are even flash fiction contests in magazines for writers, so this template is a good practice for those!

Invertebrates as Webmasters in Ecosystems July 10, 2020 Invertebrates are conspicuous, influential components in all of the ecosystems of the world. Assemblages of invertebrates assume an organizing function and hence may be considered as "webmasters" in these ecosystems. This book reviews and assesses our current understanding of the role of invertebrates in terrestrial and terrestrially-dominated (lower-order stream) ecosystems. It emphasizes the centrality of the activity of invertebrates, which influence ecosystem processes in proportion to their physical mass in a wide range of situations, particularly at the interface between land and air (litter/soil), water and land (sediments) and in soil and root/soil systems.

Foundations of Structural Geology July 17, 2021 Since the first edition was published in 1983, this highly-regarded introductory textbook has been used by many geology students worldwide. It is specifically tailored to the requirements of first or second year geology undergraduates. The third edition has been extensively revised to include many new sections and over 50 new or redrawn illustrations. There are now over 220 illustrations, many incorporating a second colour to highlight essential features. The format has been changed to enhance the visual attractiveness of the book. The tripartite organization of the first and second editions has been modified by combining descriptive or factual aspects of fault and fold structure in the earlier chapters with a simple treatment of mechanisms, leaving the more geometrically complex aspects after the relevant sections on stress and strain, as before. Some subjects are introduced for the first time, e.g. inversion and orogen collapse, and others have been modified, e.g. the chapter on gravity controlled structures now emphasises modern work on salt tectonics. The last third of the book is devoted to the wider context of structures and how they relate to plate tectonics. The final two chapters have been considerably expanded and give examples of various types of geological structures in tectonic settings in both modern and ancient orogenic belts.

Biogeomorphology Oct 24 2021 Biogeomorphology is concerned with the influence of landforms on the distribution and development of plants, animals and micro-organisms with the influence of plants, animals and micro-organisms on earth surface processes and the development of landforms. In most situations these influences are related with respect to environmental equilibrium or change. This volume of new essays considers a wide range of biological influences in geomorphology. It is divided into three parts: a particular geographical area and climatic criteria. The first part of the work is concerned with organic influences on landforms in temperate fluvial environments. The second part presents evidence from tropical, arid and periglacial environments. Part three deals with coastal and karst environments. This is the first book on this important field. It will be of considerable interest to geomorphologists, geologists and biologists, as well as to those involved in environmental planning and in using or modifying the land. of plants and animals on the surface of the earth.
